These two values much match

https://localhost:3333/about

app.get("about" ....

Discord Bot
https://localhost:3333/about

2. Our server figures out
what code should run

1. The browser connects
to the server

server.js

app.get("/about", (request, response) => {
  response.render("pages/about");
});

3. Our server renders
HTML from an EJS file

views/templates/page.ejs

<html>
  <body>

views/pages/about.ejs

<h1>About Us</h1>
<p>Some text on the page</p>

</body>
</html>

4. EJS generates HTML
from the page and the

html

<html>
  <body>

<h1>About Us</h1>
<p>Some text on the page</p>

</body>
</html>

This isn't an actual file.
It's generated by our
server and sent off
every time someone
visits the site.

5. The HTML is sent to
the browser

Discord Bot
https://localhost:3333/about

About Us

Some text on the page

response.render("pages/about");

views/pages/about.ejs
